SUMMARY

BURNUP REPORT

1. Did your estimations reflect the actual effort?

Yes. The story point estimates generally reflected the relative effort and complexity of the incident management features. Stories involving alert monitoring, on-call assignment, and incident escalation required more effort because they involve system logic and timing, while simpler stories such as viewing incident status and acknowledgement required fewer points.

2. Was your backlog well-prioritized?

Yes. The backlog was prioritized based on the importance of handling incidents quickly and reliably. Core functionality such as alert monitoring, on-call engineer assignment, incident escalation, and engineer notification was given higher priority because these features are essential for responding to incidents. Tracking and post-mortem features were prioritized after the core incident response workflow.

3. How did your simulated sprint align with your plan?

The simulated sprint generally aligned with the planned backlog. The sprint focused first on the core incident response functionality, including alert monitoring, on-call assignment, escalation, and engineer notifications. The stories were completed according to their priority, allowing the main incident-handling workflow to be addressed before secondary features such as incident tracking and post-mortem management.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart showed how much work the team was able to complete during the sprint and helped identify the team's overall capacity. It showed that the workload was manageable when the higher-priority stories were tackled first. The chart also helped track remaining work and indicated whether the team was progressing at the expected rate, which can be used to improve story-point estimation and sprint

planning in future sprints.
